

Developing a machine learning-based instrument for subjective well-being assessment on Weibo and its psychological significance: An evaluative and interpretive research

Article format: Research article prepared against Applied Psychology: Health and Well-Being Original Paper guidance. This is an independent computational reanalysis of a supplied dataset, not a newly recruited study or a claim of eligibility to republish an existing study.

Authors and affiliations

TO BE COMPLETED BY AUTHORS: author names, institutional affiliations, ORCID identifiers, correspondence address, email, author order, and confirmation that every listed author approves the final manuscript and accepts responsibility for the work. No author or affiliation has been inferred from the data-collection description.

Study provenance and publication status

The supplied working title was “Developing a machine learning-based instrument for subjective well-being assessment on Weibo and its psychological significance: An evaluative and interpretive research.” The manuscript uses the supplied working title. The scope and limitations of the instrument evaluation are described in the manuscript. The supplied Title and Method remain preserved in `main_context.md`.

The task explicitly states that the underlying study has already been published. Its published text, abstract, and results were not sought or used. Before any submission, the responsible authors must resolve the relationship to the existing publication, attribution of reused design information, originality or secondary-analysis eligibility, relevant permissions, and any necessary overlap disclosure. No journal submission has been attempted or authorized by this document.

Ethics approval and informed consent

According to the supplied collection description, the original research was approved by the Institutional Review Board of the Institute of Psychology, Chinese Academy of Sciences, under code H15009. The supplied description states that participants gave informed consent, took part voluntarily, could withdraw, and received a monetary reward for completion. It also describes anonymization and privacy protections.

These statements are attributed to the supplied source. The approval document, recruitment text, exact consent language, compensation amount, anonymization procedure, and authorization for the present secondary analysis were not independently verified. TO BE COMPLETED BY AUTHORS: verify the original approval and consent, identify any secondary-use approval or exemption if required, and confirm that the retained data and proposed sharing respect the applicable consent. Stable UID values remain in the local computational package, so irreversible anonymity must not be presumed.

Author contributions

TO BE COMPLETED BY AUTHORS: identify contributions to the original data collection, data curation, conceptualization, methodology, software review, validation, interpretation, manuscript preparation, supervision, and final approval. Automated work must not be represented as an already completed human contribution or approval.

Funding

TO BE COMPLETED BY AUTHORS: disclose all funding sources, grant identifiers, and funder roles in the original collection and this secondary analysis, or confirm an accurate statement of no funding. No-funding status cannot be inferred from missing information.

Conflicts of interest

TO BE COMPLETED BY AUTHORS: provide declarations for every author and any relevant financial or nonfinancial relationships. The absence of conflicts has not been established.

Data and code availability

The original supplied CSV, analysis scripts, environment lock, retained model runs, predictions, tables, figures, and manuscript sources are included in the local research package. No data have been publicly deposited or assigned a persistent identifier. TO BE COMPLETED BY AUTHORS: name the authorized data custodian, define access restrictions and permissions, confirm what may be released, identify an appropriate repository, and add a persistent dataset/code citation when available. This paragraph does not promise access on behalf of the original data owner.

Use of artificial intelligence

An OpenAI Codex assistant was used for data auditing, protocol drafting, analysis-code development and execution, literature retrieval and evidence checking, Zotero ingestion, figure generation, and manuscript drafting. Additional computational review passes inspected code, source claims, and rendered documents. Automated checks do not constitute responsible human-author review. TO BE COMPLETED BY AUTHORS: inspect and approve the methods, outputs, references, interpretation, provenance, and declarations, and identify the tool/version information required by the journal's disclosure form. No AI tool is listed as an author.

Acknowledgments

TO BE COMPLETED BY AUTHORS: identify contributors who do not meet authorship requirements and obtain any required consent to be named. No acknowledgment of an individual has been fabricated.

Submission preparation status

The computational reanalysis and manuscript can be inspected and reproduced locally. The document remains a research draft until missing author-controlled declarations, source-data authorization, original-publication relationship, and human accountability are resolved. Unavailable original posts, questionnaire items, verified score transformation, dictionary provenance, and demographic fields constrain the scientific claims even after declarations are completed.
