

Developing a machine learning-based instrument for subjective well-being assessment on Weibo and its psychological significance: An evaluative and interpretive research

Running title: Language and subjective well-being

Article type: Secondary computational research manuscript, prepared against the project's recorded *Applied Psychology: Health and Well-Being* Original Paper guidance. Author approval and submission eligibility remain pending.

Authors, affiliations, and correspondence

TO BE COMPLETED BY AUTHORS: full names, author order, institutional affiliations, ORCID identifiers, corresponding author's postal address and email, and approval by every listed author. Neither repository ownership nor the institution named in the original collection documentation has been used to infer authorship or present affiliations.

Study provenance and relationship to prior publication

The manuscript retains the supplied working title and describes a secondary analysis of the supplied feature matrix and questionnaire-derived scores. The underlying task states that the original study has already been published. Its published text, abstract, and results were not sought or used for this writing task. Before any submission, responsible authors must resolve attribution of reused design information, the relationship to that publication, scientific originality and secondary-analysis eligibility, relevant permissions, and required overlap disclosure. No submission or publication authorization is implied by preparation of these files.

Ethics approval and informed consent

According to the supplied collection description, the original research was approved by the Institutional Review Board of the Institute of Psychology, Chinese Academy of Sciences, under approval H15009. It reports informed consent, voluntary participation, withdrawal rights, monetary compensation, and anonymization/privacy protections. These are attributed statements, not independently verified approvals for the present secondary use.

TO BE COMPLETED BY AUTHORS: inspect the approval document and consent wording, verify recruitment and compensation information, confirm any required secondary-use approval or exemption, and define permitted data retention and release. Stable participant identifiers in source research materials should not be assumed to constitute irreversible anonymization.

Data, code, and materials

The public project repository is <https://github.com/Timisic/autopsy>. The source snapshot inspected for this revision was commit 51e1e780111c712e43e1202e2b9f305111f3eaf3, with the docu-

mented 2026-09-24 v3 baseline. Public contents include analysis code and aggregate results; participant-level records, original posts, individual predictions, and fitted model objects are not included. This independently prepared writing package has not been pushed to the repository.

TO BE COMPLETED BY AUTHORS: identify the data custodian, access restrictions, consent-compatible sharing permissions, dataset citation, and an appropriate anonymized review link and archival persistent identifier. The repository address does not authorize access to restricted records or promise their release.

Contributions, funding, conflicts, and acknowledgments

TO BE COMPLETED BY AUTHORS: identify contributions to original collection, curation, conceptualization, methodology, software review, validation, interpretation, writing, supervision, and approval. Report funding sources, grant identifiers, and funder roles, or verify an accurate no-funding statement. Obtain financial and nonfinancial conflict declarations from all authors, and confirm acknowledgments and permission to name contributors. Absence of supplied information is not evidence of no funding or no conflicts.

Artificial-intelligence assistance and accountability

Project records attribute earlier computational analysis and drafting assistance to OpenAI Codex. ChatGPT assisted with the present restructuring, bilingual writing, targeted literature verification, aggregate-based tables and figures, and typesetting checks. No AI system is an author. Responsible authors must review the entire scientific record and final text, confirm the applicable tool/version disclosure, and accept accountability. Automated checks and editorial completion do not replace this review.

Author decision required before submission

The bilingual texts are complete editorial drafts. Submission requires resolution of authorship and approval, original-publication overlap, ethical and data-use authorization, and the missing declarations above. Scientific limitations concerning score transformation, original text, item responses, and dictionary provenance remain even after administrative declarations are completed.
